CISQ-TR-2012-01

CONSORTIUM FOR IT SOFTWARE QUALITY

# CISQ Measures and ISO 25010

- **Starting point for CISQ work**
  - Defines quality characteristics and sub-characteristics
  - CISQ to define quality attributes and measurable elements

# Example Measure for Reliability

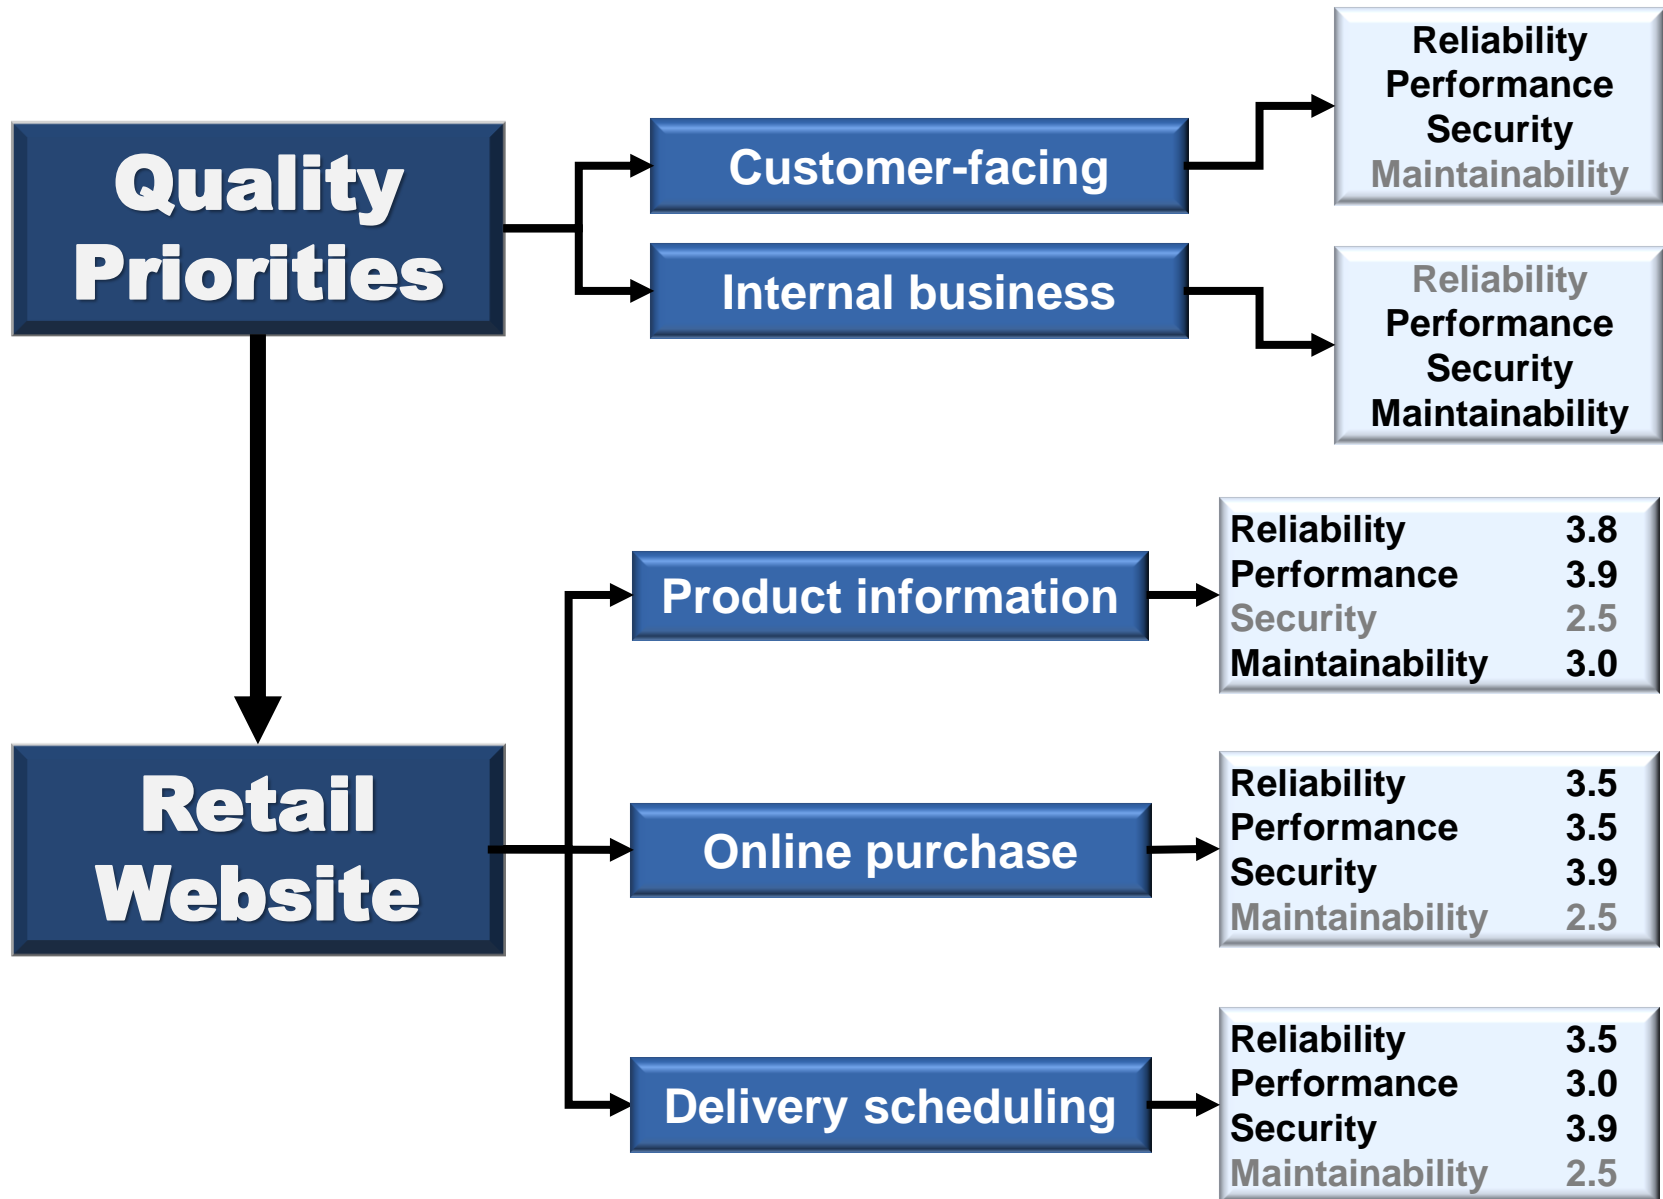

Quality Issue	Quality Rule	Quality Measure Element
<b>Issue 1:</b> Inconsistent or incomplete handling of errors and exceptions leads to inaccurate identification and inadequate response to errors	<b>Rule 1:</b> Exception handling blocks such as Catch and Finally blocks must not be empty.	<b>Measure 1:</b> # of exception handling blocks such as Catch and Finally blocks that are empty <b>Measure 2:</b> # of generic exceptions thrown and caught
	<b>Rule 2:</b> Methods, procedures and functions doing Insert, Update, Delete, Create Table or Select must include error management (check of database error variables or exception handling).	<b>Measure 3:</b> # of functions doing Insert, Update, Delete, Create Table, and Select that do not include error management capabilities
<b>Issue 2:</b> Some coding weaknesses result in unexpected and faulty behaviors	<b>Rule 3:</b> Classes that implement a serializable interface must also implement a serializable method and subfields within the object that are serializable.	<b>Measure 4:</b> # of classes that implement a serializable interface must also implement a serializable method <b>Measure 5:</b> # of classes that have

# Recommendations for Using Measures in SLAs

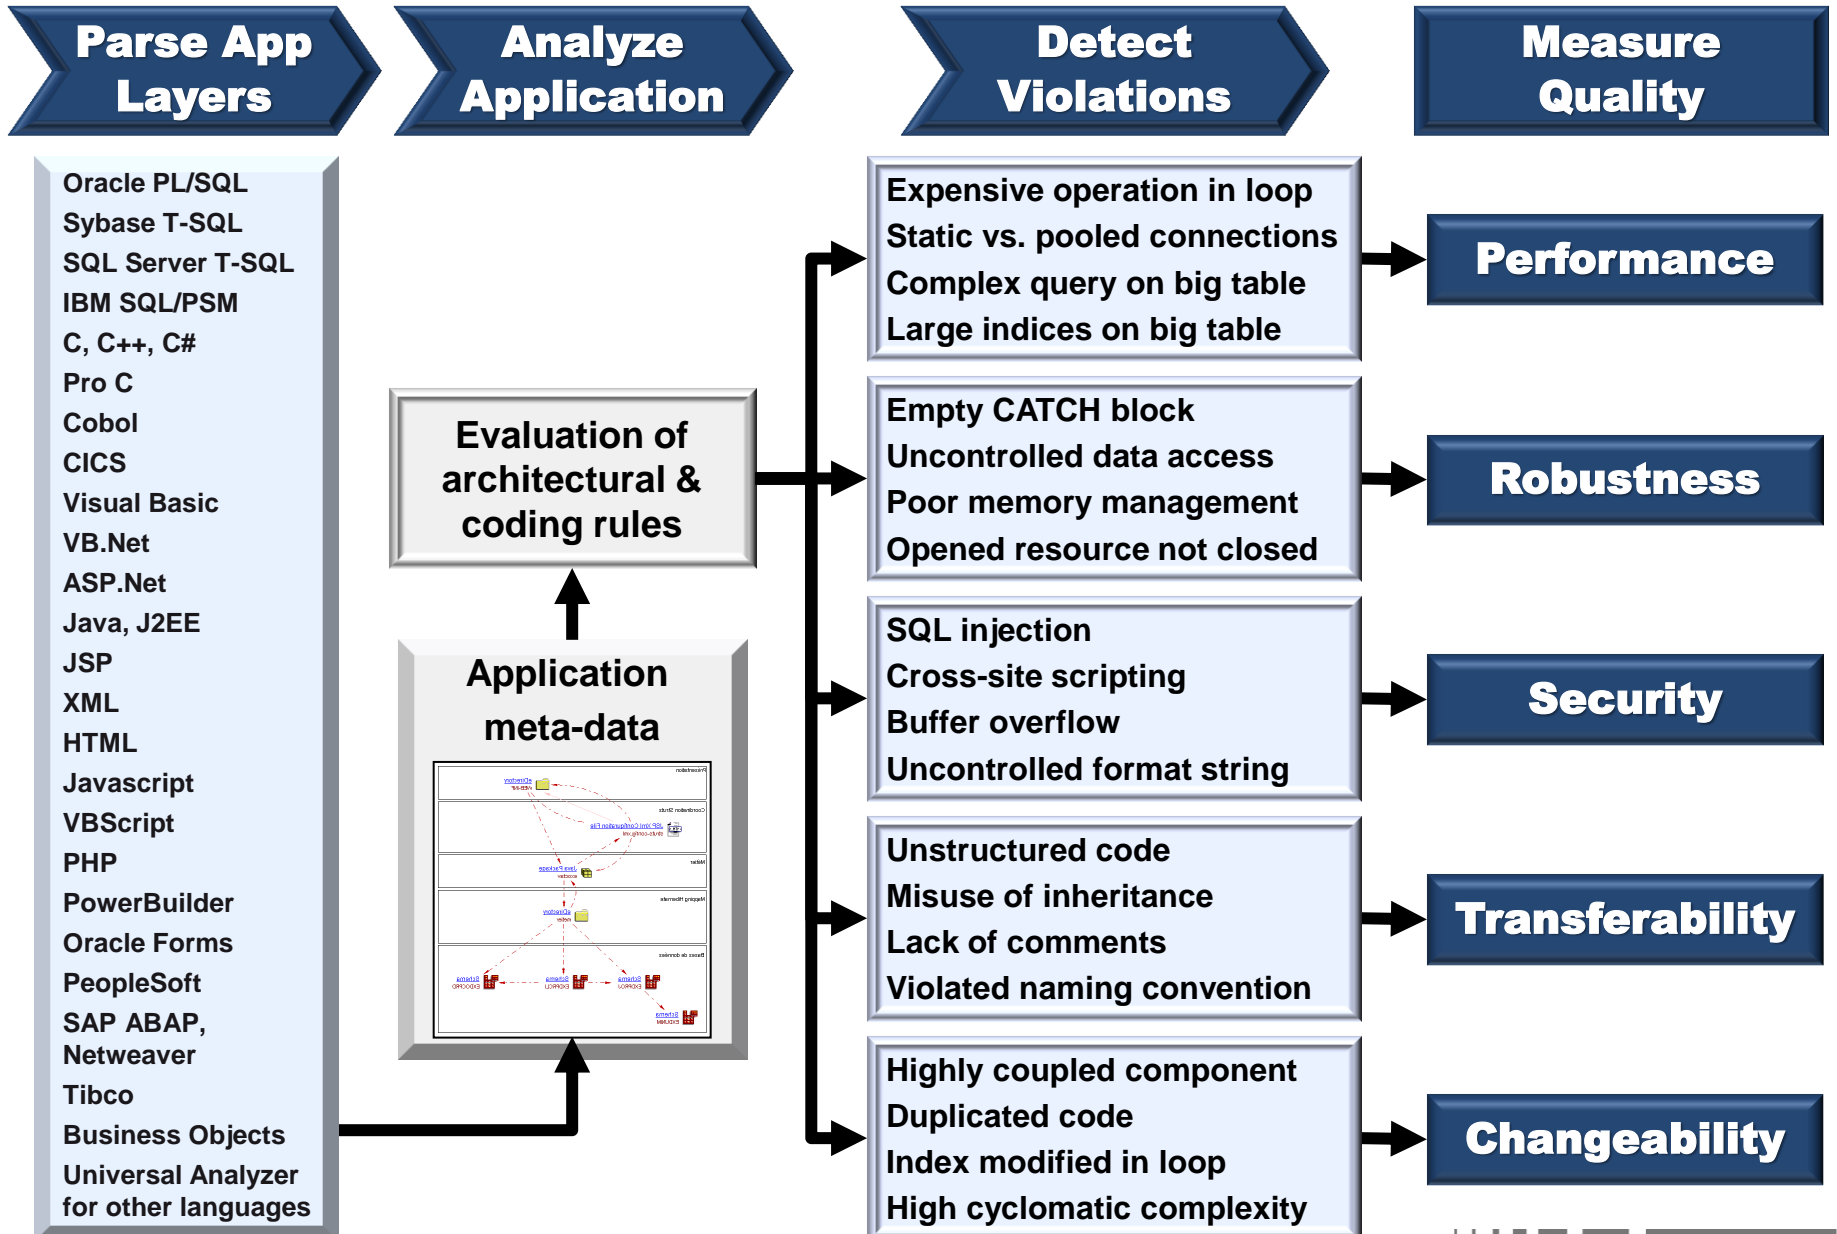

1. Set structural quality objectives
2. Measure unacceptable violations
3. Use a common vocabulary
4. Measure quality at system level
5. Define roles and responsibilities
6. Follow a measurement process
7. Evaluate contract deliverables
8. Use rewards and penalties wisely

# 1—Set Structural Quality Objectives

# 2—Measure Unacceptable Violations

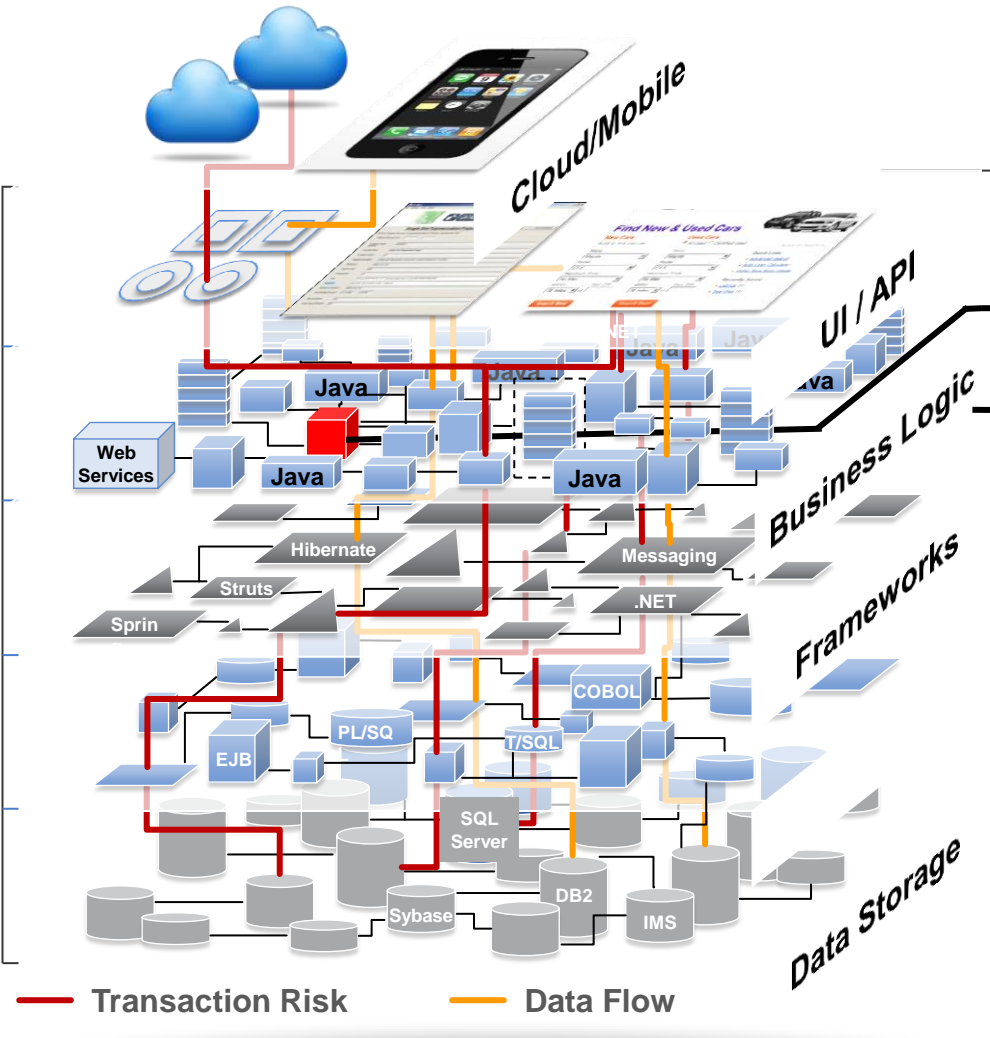

### 3—Use a Common Vocabulary

<b>Term</b>	<b>Definition</b>
<b>Software Quality</b>	Software quality will be measured by the CISQ Quality Characteristic measures for Reliability, Security, Performance Efficiency, and Maintainability
<b>Application Size</b>	Application size will be measured by the CISQ specification for Automated Function Points. The work performed on an application will be measured by the CISQ Enhanced Function Point measure
<b>Violations</b>	Application source code that violates a rule incorporated into one of the four CISQ Quality Characteristic measures or a coding standard incorporated into an SLA
<b>Unacceptable Violations</b>	Violations specified in an SLA that must not exist in delivered code. All unacceptable violations must be remediated before delivery will be accepted
<b>Minimum Threshold</b>	Minimum score established in an SLA that must be attained on one or more CISQ Quality Characteristic measures for a delivery to be accepted. Failure to achieve the minimum threshold can result in rejection of the delivery or financial penalties
<b>Expected Target</b>	The score established in an SLA that should be attained on one or more CISQ Quality Characteristic measures that the supplier should seek to achieve and sustain over releases. A schedule over several releases may be established for achieving the expected target

# 4—Measure Quality at System Level

Architecture Compliance

1

## Unit Level

- Code style & layout
- Expression complexity
- Code documentation
- Class or program design
- Basic coding standards
- Developer level

2

## Technology Level

- Single language/technology layer
- Intra-technology architecture
- Intra-layer dependencies
- Inter-program invocation
- Security vulnerabilities
- Development team level

3

## System Level

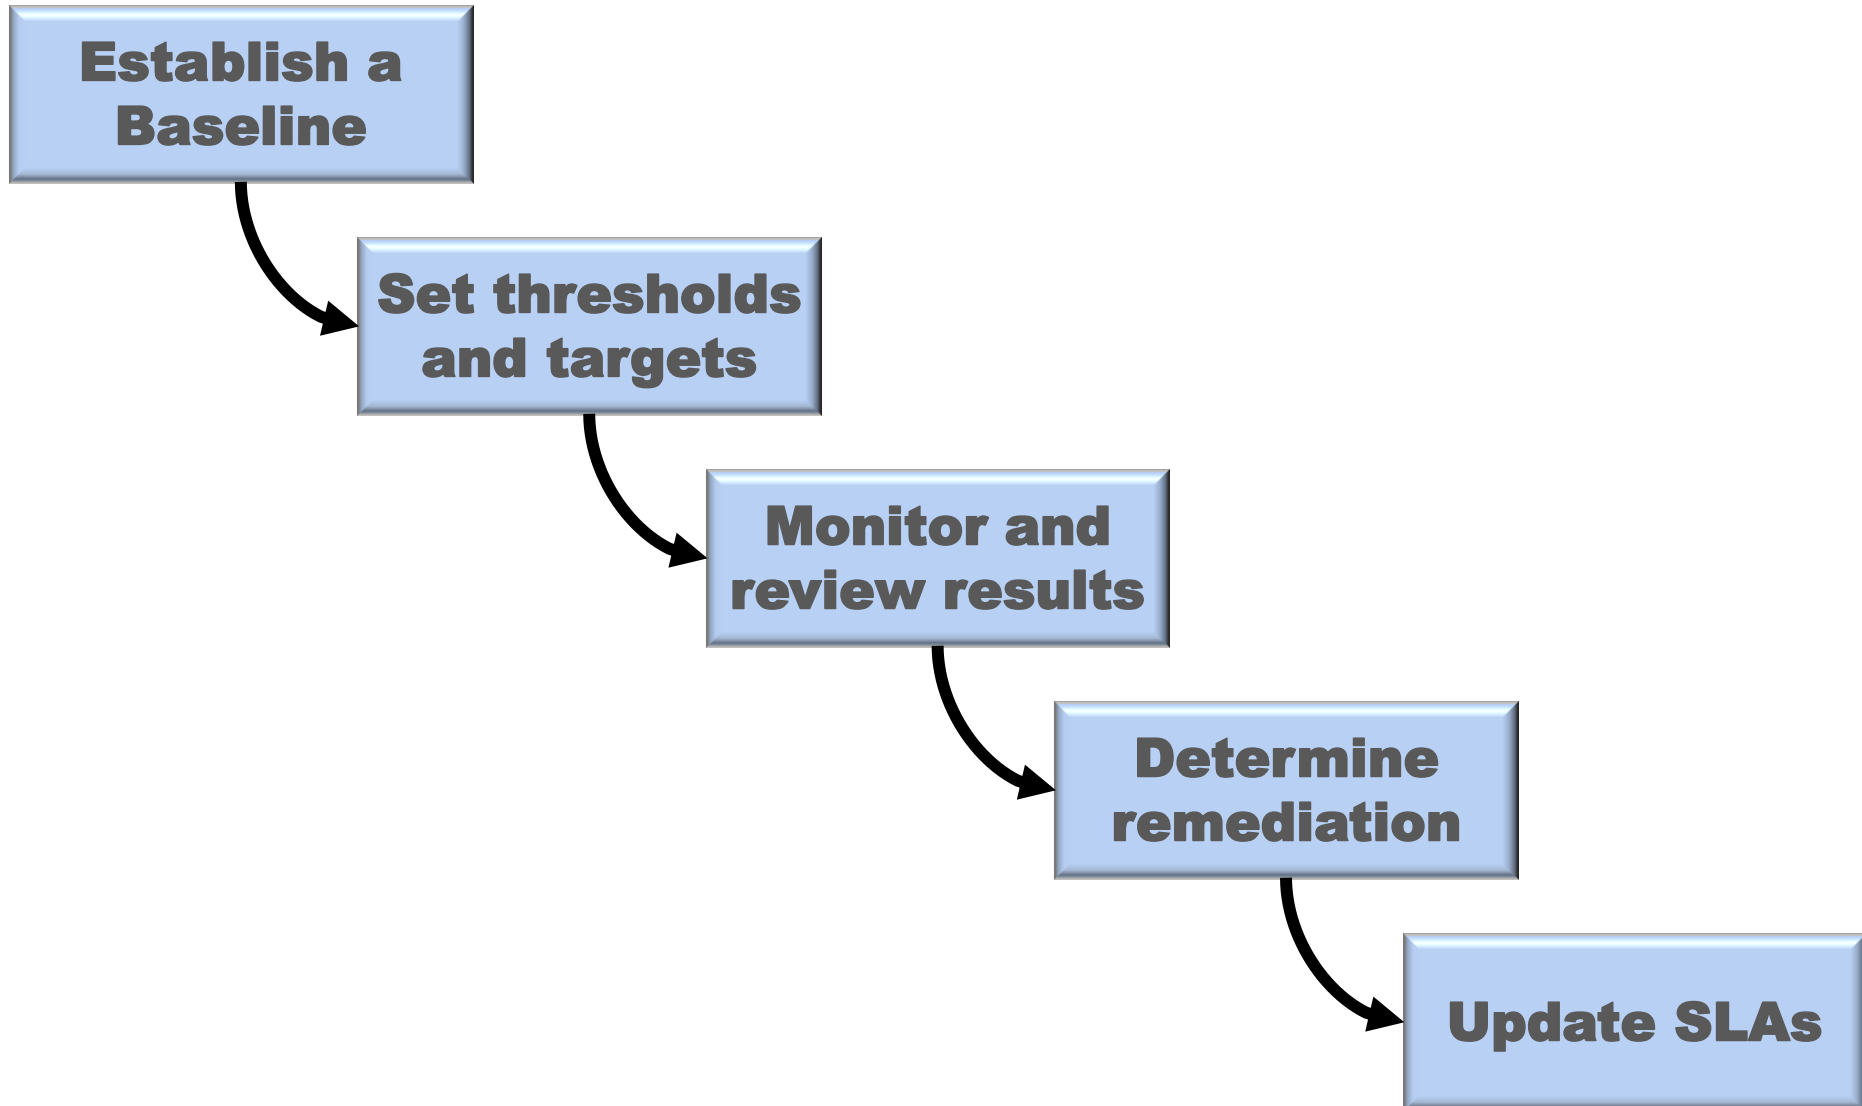

- Integration quality
- Architectural compliance
- Risk propagation
- Application security
- Resiliency checks
- Transaction integrity
- Function point, Effort estimation
- Data access control
- SDK versioning
- Calibration across technologies
- IT organization level

# 5—Define Roles and Responsibilities

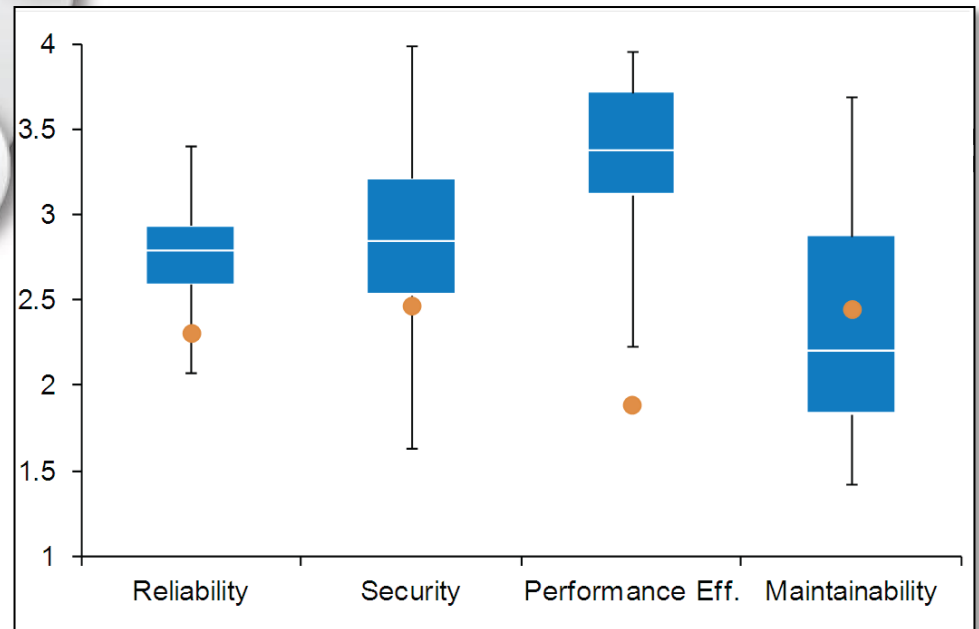

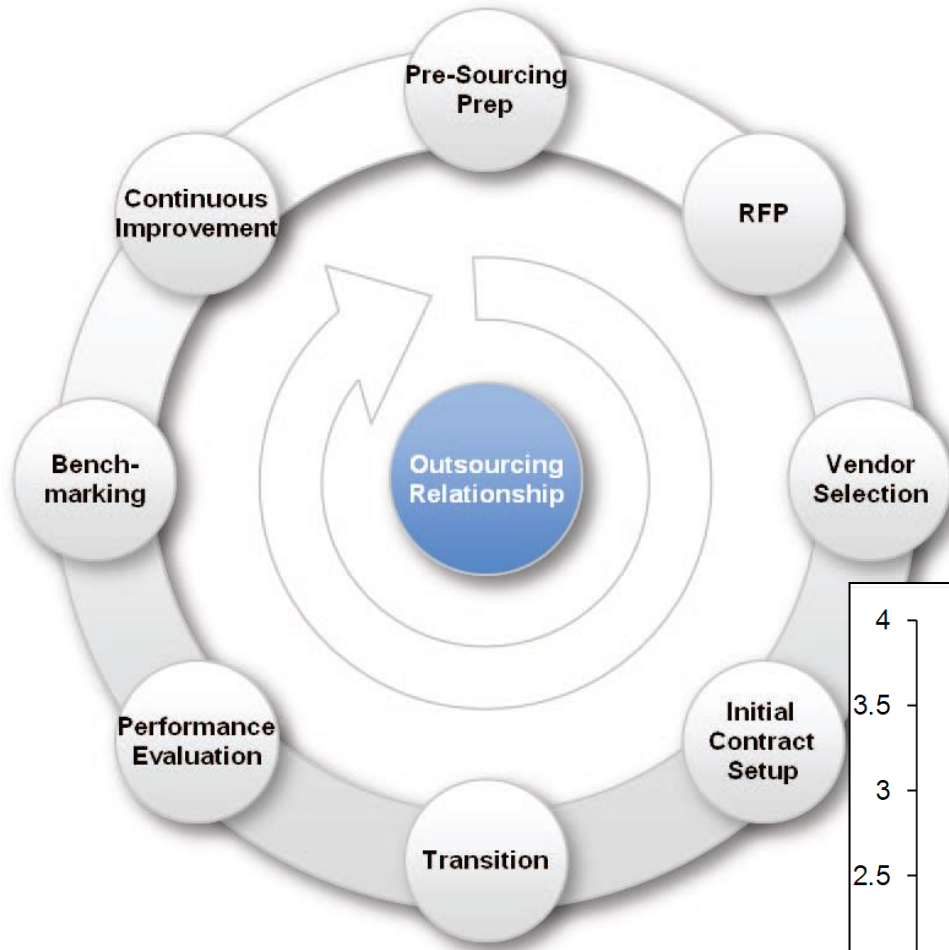

<b>Customer</b>	<b>Supplier</b>
For each application under contract, the company should develop SLAs in consultation with the supplier that clearly define the minimum threshold and expected target of measures, as well as all unacceptable violations that may not be in the source code at delivery.	The supplier should make all developers, testers, and other staff involved with the application aware of the SLA requirements and how they are to be achieved and sustained.
In their SLAs the company should clearly define the measures to be used in assessing these thresholds and targets and how the scores will be determined.	For each application the supplier should commit to meet the minimum threshold and provide an action plan for achieving the expected target scores defined in the SLAs.
They should conduct a defined analysis and measurement process when code is delivered and provide a report to the supplier that clearly describes the results and any actions expected of the supplier.	The supplier should conduct quality assurance activities during the development period to ensure that SLA agreements will be achieved.
Customers should host a post-analysis meeting with a supplier representative to discuss measurement results and plan for future actions and expectations regarding application size and structural quality.	Upon request, the supplier should deliver whole source code including SQL structure definition files of the application to support an application audit by the customer, even if the new release does not modify all components of the application.
	The supplier should meet with the customer to discuss results of analysis and measurement activities, to identify any remedial action required immediately, and to plan for future actions and expectations regarding application size and structural quality.

# 6—Follow a Measurement Process

---

# 7—Evaluate Contract Deliverables

# 8—Use Rewards and Penalties Wisely

- Vendor
- Profit goals
- Contract terms
- Penalties

- Partnership
- Common goals
- Negotiation
- Rewards

## Consortium for IT Software Quality

The Consortium for IT Software Quality (CISQ) is an IT industry leadership group comprised of IT executives from the Global 2000, system integrators, outsourced service providers, and software technology vendors committed to introduce a computable metrics standard for measuring software quality & size. CISQ is a neutral, open forum in which customers and suppliers of IT application software can develop an industry-wide agenda of actions for improving IT application quality and reduce cost and risk.

“ Every client we work with has a different understanding of 'quality' in application development and maintenance. We need a way to have consistent and objective dialog about this important issue across the industry.
